

Life on the Moon

Srija Biswas, 11 Years, India

As we landed on the moon, I felt joy swelling up inside me. Soon, we wore heavy iron boots, so the feather-like feeling of lightness was gone.

Various connected glass domes were set up, with a green jumble of plants grown in a broad line along the inner glass rim, for a natural supply of oxygen and food. Two of these domes were for us to live in, one for cooking food and other for storing extra belongings.

There were another two for science, one of them for observing the earth as the moon rotates around it, and sending signals about which place is losing greenery faster, and where there is more climate change. In the other one, all the experiments and analysis are going on, and we have already made an arrangement in space called the Moon-Light-Solaris to reflect sunlight to the moon in a controlled manner to get the required light and energy from the sun.

We have also launched four rockets, each from a separate angle towards a comet, they've collided with it and have stuck there. So, we can now propel the comet by controlling the rockets! We're bringing it towards the moon now, to get the ice and melt it to water.

So now that we're settled, it feels almost like home. In a few years' time, there may be more people living here! But, we must never forget to care for the Earth, and see that we've got always a place to return to.
