

**Powers:** Superhuman speed and strength

Flash's powers are the result of the skeletal, muscular, and respiratory systems working together.

The skeletal system is made up of bones that shape and protect the body. Muscles make up the muscular system. Muscles attach to bones to move the body. The respiratory system provides muscles with oxygen and takes away the carbon dioxide. These 3 body systems work together to ensure that Flash is able to respond to any situation at the speed of light!
